Magniscreen – Instructions for Adjusting Screen Size

Please follow the steps below carefully to shorten the aluminium frame and mesh to the required height.

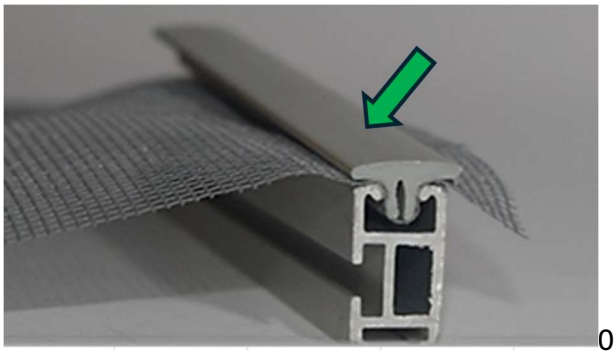

Tools Required

- Measuring tape
- Marker or pencil
- Fine-tooth hacksaw or aluminium cutting tool
- Sharp utility knife or scissors

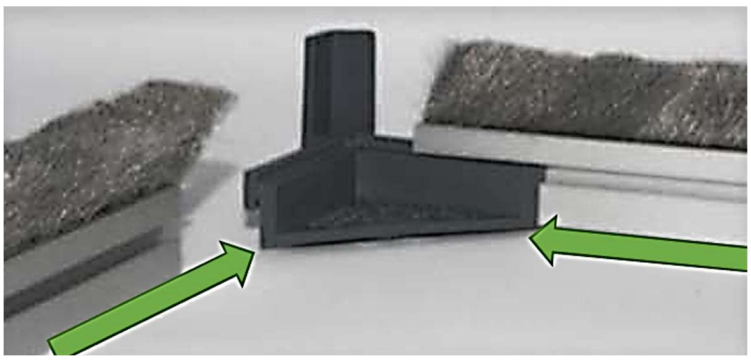

Step-by-Step Instructions

1. **Release the top PVC clip**
   On the side of the screen that does not require shortening, gently lift the entire PVC clip that secures the mesh within the aluminium profile.

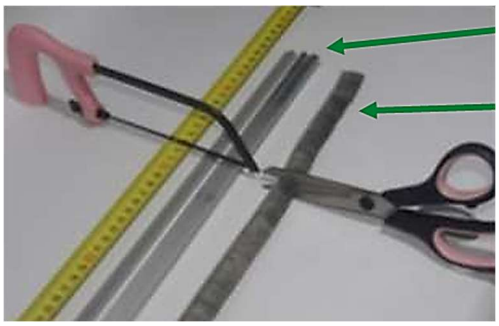

2. **Release the side PVC clips**
   Lift the PVC clips on both side profiles only along the section where the aluminium needs to be shortened.
   Note: You do not need to remove the full length of the clips—only the portion to be cut.

0..

3. **Remove the profile which links the sides that needs to be shorten**
   Slide the top aluminium profile out of the side profiles.

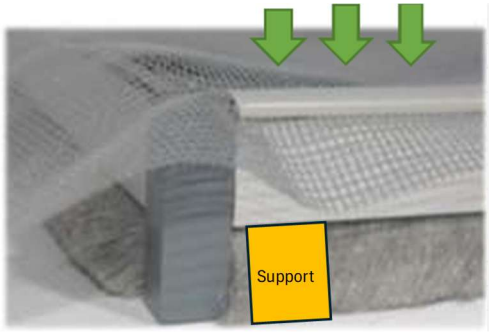

4. **Shorten the side profiles**
   Measure and mark the required length. Carefully cut both side aluminium profiles and PVC strip to the desired length.

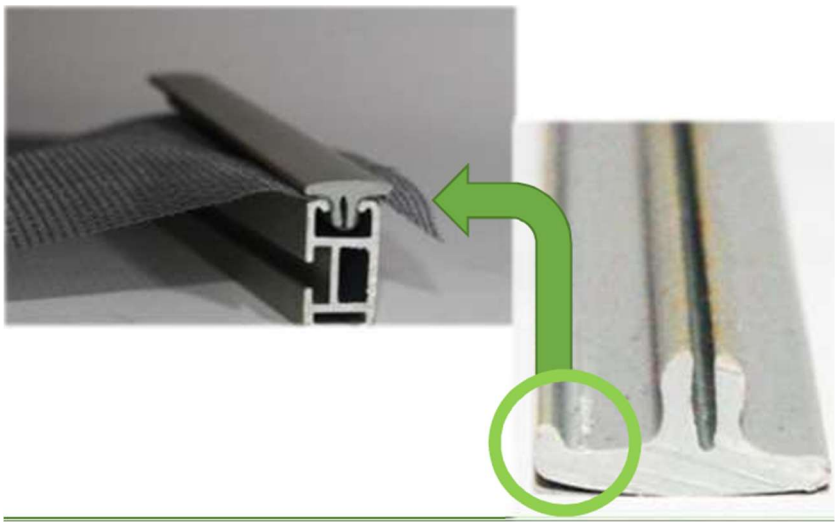

5. **Reassemble the frame**
   Slide the top aluminium profile back into the side profiles. Press the PVC clips firmly back into place to secure the mesh.

   Note:

   - **Support the Corners:**
     Place a small support block (eg. wood/aluminium) under each corner piece when pressing in the PVC strips. This prevents the corner pieces from cracking.

   - **Clip Orientation:**
     The **lip** of the PVC strip must face the **outside** of the screen (toward the flat side of the aluminium frame).

6. **Trim excess mesh**
   Cut off any excess mesh using a sharp utility knife.

.

Important Notes

- Always measure twice before cutting.
- Ensure both side profiles are cut to exactly the same length to keep the frame square.
- Take care not to damage the mesh when trimming.
