WOODEN, ALUMINIUM AND PVC WINDOW FRAMES

HOW TO STICK METAL PLATES TO THE WINDOW FRAME

1 Ensure the screen is the correct size for the window and the magnets do not clash with window fittings.

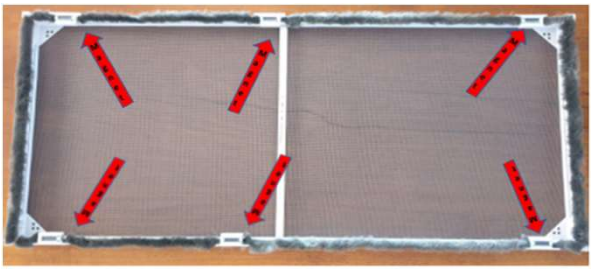

2 Move the magnets on the screen if need be.

3 Clean window frame from dirt.

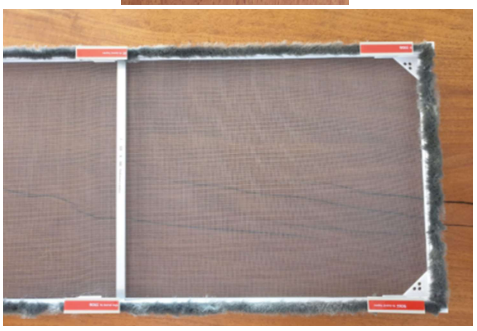

4 Put the screen on a flat surface with the magnets facing upwards.

5 Place metal plates on the screens' magnets with the red glued side facing upwards. Make sure all magnets have plates. The plates will stick magnetically to the screens' magnets.

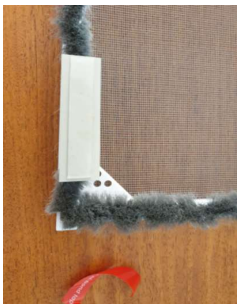

6 Remove the red protective strips from the glued metal plates.

7 While all the metal plates are still sticking to the screens' magnets, place the screen in the correct position on the window frame. Apply some presure on the screen frame to allow the glue to stick firmly to the window frame.

8 Remove the screen from the window frame and ensure the glued plates stick firmly onto the window frame by rubbing the plates while applying pressure.

9 Place screen back on the window frame

10 Glued plate can be moved/ removed/ re-used.
